Page 3 Classification Kingdom Animalia (Animals) Phylum Arthropoda (Arthropods) Explanation of Names from the Greek arthron (άρθρον)- "joint" + podos (πόδος)- "of foot, leg"; refers to the jointed legs of all members in the phylum Numbers Worldwide: (1)(2) 15 classes >120 orders ~2140 families [doesn't sound right, as Crustacea alone have >1000, Myriapoda close to 200, Arachnida and Hexapoda close to a thousand each, too... =v=] >1.3 million described species (plus many more undescribed) Size ranges from the smallest mite (about 0.10 mm) and the smallest insect (a Hymenopteran, Dicopomorpha echmepterygis at 0.139 mm), up to the Japanese Spider Crab (legspan to 3.8 m), but most arthropods are in the range 2-25 mm Identification Three or more pairs of jointed legs (some mites have less, many insect larvae have none) Body segmented, bilaterally symmetrical Possessing an exoskeleton, usually tough, composed in part of chitin(2) See Glossary for terminology. Habitat Almost every habitat Print References Giribet, G., and Edgecombe, G. D. 2019. The Phylogeny and Evolutionary History of Arthropods. Current Biology 29(12): R592-R602. Internet References Tree of Life (Maddison 1995) Insect Morphology (illustrated glossary) International Spider Survey The black-tailed red sheet weaver (Florinda coccinea.) These spiders get their name from the black cerebellum or tail and the webs they weave, which resemble a sheer material. They have two different parts of their web. The top part is intended to knock flying insects down, and the bottom sheet catches them in a non-sticky web where the spider attacks the prey. They can be instrumental in controlling flying bugs in your yard and are even encouraged as a pest control method in agriculture. They were historically popular among Florida orange groves. The spiders can be found upside down in their webs. Typically, males are either the same size or smaller than the female. Smaller males can sometimes be seen on the same web as larger females. Both take part in creating the web and cleaning it. Talk about the perfect couple. Mating can get a bit complex, though. The courtship ritual of these spiders consists of 18 different behaviors ranging from reduction of the web to the act of copulation. Spider sex can be a bit weird. The females first release their sex hormones onto the net. The male finds the female and reduces the web to prevent other males from reaching her. If the female approves of the male, she positions herself. If the male tries to mate without permission, there is a good chance the female may eat him. Mating is not done like most animals. The male deposits his sperm packets onto the web and then uses his pedipalps to place the packets into the female's sex organs. They are stored near the ovaries until the female decides to lay eggs. Next time someone tells you science is boring, tell them about the black-tailed red sheet weaver, and maybe they will start watching more nature and less TV! Internet References Tree of Life (Maddison 1995) Insect Morphology (illustrated glossary) by Peter Kehoma Boll There are many spider groups that are well-known by the general public: tarantulas, jumping spiders, wolf spiders, orbweavers... but one of the groups with a very large number of species, the family Linyphiidae, is usually unnoticed. Spiders of the family Linyphiidae are commonly known as sheetweavers because of the shape of their webs. A common species in the eastern United States, especially in the southeast, is Florinda coccinea, known as the black-tailed red sheetweaver or red grass spider. Being only 3 to 4 mm long, the black-tailed red sheetweaver has a red body with a small black tip on the abdomen. The legs are reddish-brown to black. Female black-tailed red sheetweaver in Mississippi, USA. Photo by Tiffany Stone.* Males and females are very similar in size, with males being slightly smaller. They can be easily distinguished by the abdomen and the pedipalps as in most spiders. Females have smaller pedipalps and a rounder abdomen, while males have larger pedipalps with a round expansion at the tip and slenderer abdomens. A male in Florida, USA. Photo by iNaturalist user rsnyder11.* The web of the black-tailed red sheetweaver, just like in other sheetweavers, consists of an horizontal sheet over which some additional threads above. Flying insects, when they collide with the threads, fall on the sheet and are captured by the spider. Typical aspect of the black-tailed red sheetweaver's web as seen in the field, here covered by dew droplets. Photo by iNaturalist user ndrobinson.** The mating behavior of the black-tailed red sheetweaver begins with the male entering the female's web. He usually cuts off part of the female's web and deposits new web at the same place. After this, he approaches the female, touches all her legs with his two anterior pairs of legs, and then start the pseudopulation, in which he introduces the tubes of his palps into the female genitalia but, as they are still empty, fertilization cannot occur. After some time playing like this, the male builds a small triangular web sheet and deposits a drop of sperm on it. He then collects the sperm with his pedipalps and approaches the female once more, this time breeding her for sure. Again, the ecology and life-history of the black-tailed red sheetweaver is not very well studied. And the same is true for almost all species in the family Linyphiidae, even though it is the second largest spider family on the planet. They are too tiny for most of us to care. - - - References: Robertson MW, Adler PH (1994) Mating behavior of Florinda coccinea (Hentz) (Araneae: Linyphiidae).
